1. Ans (B)

Applying Ampere's circuital law,

$$B \cdot 2\pi r = \frac{\mu_0 I \pi r^2}{\pi a^2} \text{ for } r < a$$

$$\text{and } B \cdot 2\pi r = \mu_0 I \text{ for } R > a$$

Taking the ratio

$$\frac{r}{R} = \frac{r^2}{a^2}$$

$$\therefore a = \sqrt{Rr}$$

2. Ans (B)

$$F - Mg \sin \theta = ma$$

$$T - \frac{Mx'}{L} g \sin \theta = \frac{Mx'}{L} a$$

$$T - \frac{Mx'}{L} g \sin \theta = (F - Mg \sin \theta) \frac{x'}{L}$$

$$T = \frac{Fx'}{L} = \frac{F(L-x)}{L}$$

$$\tau = I\alpha$$

$$mgR - NR = 4mR^2\alpha \quad \dots\dots\dots(i)$$

$$mg - N = 4m\alpha R \quad \dots\dots\dots(ii)$$

$$N = m\alpha R$$

From (i) and (ii)

$$mg = 5m\alpha R$$

$$\alpha = g/5R$$

$\therefore$ acceleration of bead 'A' is

$$a_A = \alpha R \sqrt{2} = \frac{g\sqrt{2}}{5} = 2\sqrt{2}m/s^2$$

$\therefore$ acceleration of bead 'B' is

$$a_B = \frac{g}{5} \sqrt{26} = 2\sqrt{26}m/s^2$$

1. Ans (1.50)

Experiment - I

$$\frac{1}{72} + \frac{1}{36} = \frac{1}{f} \Rightarrow f = 24cm$$

Experiment - II

$$\frac{1}{-30} + \frac{1}{60} = -p_{eq} = \frac{-1}{20}$$

$$p_{eq} = 2p_L + p_m$$

$$\Rightarrow \frac{1}{20} = \frac{2}{24} - \frac{2}{R_1} \Rightarrow R_1 = 60cm_{convex}$$

Experiment - III

$$\frac{3}{-20} - \frac{1}{7.5} = -p_{eq} = \frac{-17}{60}$$

$$p_{eq} = 2p_L + p_m$$

$$\Rightarrow \frac{17}{60} = \frac{2}{24} - \frac{2}{R_2} \Rightarrow R_2 = -10cm$$

$$\frac{1}{24} = (\mu - 1) \left(\frac{1}{10} - \frac{1}{60} \right)$$

$$\Rightarrow \mu = 1.5$$

3. Ans (24.00)

6. Ans (1900.00)

Since wall is smooth time of flight remains

unchanged

$$T = \frac{2u_y}{g} = \frac{2 \times 100}{10} = 20s$$

The particle reaches the wall

$$\text{at } t = \frac{600}{60}s = 10s$$

At $t = 10s$, the particle is at its maximum

height. Hence, $t = 10s$ and $\theta = 90^\circ$

Let Q be the point of impact on the wall.

So its X - co-ordinate = $80 \times 10 = 800m$

$$Y - \text{co-ordinate} = \frac{u_y^2}{2g} = \frac{(100)^2}{2 \times 10} = 500m$$

Z - co-ordinate = 0

$$\vec{V}_Q = 80\hat{i} + \mathbf{e} \times 60\hat{k} = (80\hat{i} + 30\hat{k}) \text{ m/s}$$

And, time to reach the XZ- plane is 10s from Q

X - co-ordinate = $80 \times 20 = 1600m$

Y - co-ordinate = 0

Z - co-ordinate = $30 \times 10 = 300m$

$$KE = \frac{1}{2} \left(\frac{23}{24} \right) MR^2 \omega^2$$

Let mass of the balloon be M and its volume on

the surface be v_0 .

$$Mg = \frac{v_0}{3} \rho g \quad \dots (i) \quad [\rho = \text{density of water}]$$

At depth 'h', the volume of the balloon will

decrease due to hydrostatic pressure. Let new

volume be v. $p_2 v_2 = p_1 v_1$ gives

$$(h + 10)v = 10v_0 \Rightarrow v = \frac{10v_0}{h + 10}$$

for equilibrium $v\rho g = Mg$

$$\frac{10v_0}{h+10} \rho g = \frac{v_0}{3} \rho g \quad [u \sin g (i)]$$

$$\Rightarrow 30 = h + 10 \Rightarrow h = 20m$$

9. Ans (7)

$$Mgx + 2T_2 (6x) = 2mg (3x) + mg (7x)$$

$$mgx + 2T_1 (6x) = 2mg (3x) + Mg (7x)$$

$$T_1 = \frac{5m + 7M}{12}g, \quad T_2 = \frac{13m - M}{12}g$$

$$\therefore M < 13m \quad M_{\max} = 13m$$

$$T_1 + N_1 = Mg, \quad mg = T_2 + N_2$$

$$N_1 = \frac{5(M - m)g}{12}, \quad N_2 = \frac{(M - m)g}{12}$$

$$x = 1 \pm \sqrt{1+c}$$

$$\min([\alpha], [\beta]) = [1 - \sqrt{1+c}] = 0$$

$$\max([\alpha], [\beta]) = [1 + \sqrt{1+c}] = 1$$

$$[\alpha] + [\beta] = 1 < 2$$

$$f(x)_{\max} = f(1) = 1 + c$$

$$0 < f(1) < 1$$

1. **Ans (1.00)**

$$y^2 = 8x$$

$$y^3 = 8xy \Rightarrow y^3 = -8 \Rightarrow y = -2$$

$$\{\because xy = -1\}$$

$$\Rightarrow x = \frac{1}{2}$$

$$y^2 = 8x \Rightarrow 2yy' = 8 \Rightarrow y'|_{(1/2, -2)} = -2$$

$$\therefore \text{tangent at } \left(\frac{1}{2}, -2\right) \text{ is, } y + 2 = -2 \left(x - \frac{1}{2}\right)$$

$$2x + y + 1 = 0$$

$$\therefore y \text{ intercept} = -1$$

2. **Ans (0.00)**

$$\therefore y' = \cos(x+y)(1+y')$$

$$-2 = \cos(x+y)(-1)$$

$$\cos(x+y) = 2$$

Not possible

$\therefore$ no such tangent is possible

4. **Ans (27.50)**

$$S_1 = \sum_{k=1}^{10} k(k-1) \frac{10!}{k(k-1)(k-2)!(10-k)!}$$

$$= 90 \sum_{k=2}^{10} \frac{8!}{(k-2)!(8-(k-2))!} = 90 \sum_{k=2}^{10} {}^8C_{k-2} = 90 \times 2^8$$

$$\text{Now, } S_2 = \sum_{k=1}^{10} \frac{k(10)!}{k(k-1)!(9-(k-1))!} = 10 \sum_{k=1}^{10} {}^9C_{k-1} = 10 \times 2^9$$

$$\text{and } S_3 = \sum_{k=1}^{10} (k(k-1) + k) \frac{10!}{k! (10-k)!}$$

$$= \left(\sum_{k=1}^{10} k(k-1) \cdot {}^{10}C_k \right) + \left(\sum_{k=1}^{10} k \cdot {}^{10}C_k \right)$$

$$= S_1 + S_2 = (90 \times 2^8) + (10 \times 2^9)$$

$$= (90 \times 2^8) + (20 \times 2^8) = 110 \times 2^8 = 55 \times 2^9$$

5. **Ans (0.00)**

$$I = \int_1^{-1} g(1+x)dx \quad \text{Put } 1+x = 2-y$$

$$dx = -dy$$

$$I = - \int_0^2 g(2-y) dy \quad \text{and } y = 1-x$$

$$I = - \int_0^2 g(y)dy \quad \because \int_0^a f(x)dx = \int_0^a f(a-x)dx$$

$$\text{Add above equation, we get } I = 0$$

6. **Ans (16.00)**

$$\begin{aligned}
 2I &= - \int_0^2 f(x^4)dx = 2 \int_0^2 f(x^4)dx = 2 \int_0^2 (3x^2 - g(2-x))dx \\
 &= 2 \int_0^2 3x^2dx - 2 \int_0^2 g(2-x)dx = 2 \cdot \left[\frac{3x^3}{3} \right]_0^2 - 0 = 16
 \end{aligned}$$

PART-3 : MATHEMATICS
SECTION-II (ii)
7. Ans (3)

 Let $f(x) = \tan^{-1}x, x \in [a, b]$
 $\therefore$ Using LMVT, we get $\frac{\tan^{-1}b - \tan^{-1}a}{b-a} = \frac{1}{1+c^2}$,

 where $0 < a < c < b < \sqrt{3}$

 So, $1 < \left(\frac{b-a}{\tan^{-1}b - \tan^{-1}a} \right) < 4$

 As, $\frac{1}{4} < \frac{1}{1+c^2} < 1$
 $\Rightarrow$ The greatest possible integral value is 3.

8. Ans (3)

$$\int_0^{\pi/2} \frac{dx}{\cos^2 x (1 + \sqrt{\tan x})^4} = \int_0^{\pi/2} \frac{\sec^2 x}{(1 + \sqrt{\tan x})^4} dx$$

 Put $\tan x = t^2 \Rightarrow \sec^2 x dx = 2t dt$

$$\int_0^\infty \frac{2t}{(1+t)^4} dt = 2 \int_0^\infty \left(\frac{1}{(1+t)^3} - \frac{1}{(1+t)^4} \right)$$

$$dt = 2 \left(\frac{-1}{2(1+t)^2} + \frac{1}{3(1+t)^3} \right)_0^\infty$$

$$= \left(\frac{-1}{2(1+t)^2} + \frac{1}{3(1+t)^3} \right)_0^\infty$$

$$= 2 \left(0 - \left(\frac{-1}{2} + \frac{1}{3} \right) \right) = 2 \left(\frac{1}{2} - \frac{1}{3} \right) = \frac{1}{3}$$

9. Ans (100)

$$[\{x\}] = 0$$

$$f(x) = (3 - x^7)^{\frac{1}{7}}$$

$$f(f(x)) = \left(\left(3 - (3 - x^7)^{\frac{1}{7}} \right)^7 \right)^{\frac{1}{7}} = x$$

$$f(f(x)) = x \Rightarrow f^{-1}(x) = f(x)$$

$$\therefore f^{-1}(50) = f(50) \text{ and } f(f(100)) = 100$$

$$\therefore f^{-1}(50) - f(50) + f(f(100)) = 100$$
